

Two routes to serve the operating envelope

Advantage map (§1.3)
seed-banded operating envelope

```
graph TD; A[Advantage map (§1.3)  
seed-banded operating envelope] --> B[SELECTION — runtime gating (§3.1)  
estimate context (density, SINR proxy)  
→ route GNN vs. heuristic per frame]; A --> C[UNIFICATION — governed generalist (§3.2)  
one model over all cells +  
gradient governance (GradNorm)]; B --> D["+ zero deploy-time training  
+ interpretable routing  
- needs expert/heuristic set  
- only as good as estimable context"]; C --> E["+ single artifact, no routing  
+ interpolates off-grid  
- offline governance step  
- hides per-cell rationale"];
```

SELECTION — runtime gating (§3.1)
estimate context (density, SINR proxy)
→ route GNN vs. heuristic per frame

- + zero deploy-time training
- + interpretable routing
- needs expert/heuristic set
- only as good as estimable context

UNIFICATION — governed generalist (§3.2)
one model over all cells +
gradient governance (GradNorm)

- + single artifact, no routing
- + interpolates off-grid
- offline governance step
- hides per-cell rationale
